

TAM Projects And Development:

As shown in figure 1A our in-house manufacturing and development unit demonstrates that we are currently the UK's most significant manufacturer and supplier of TAM pipes, packers and other grouting products. Having supplied to all the geotechnical companies on the city of London's Jubilee Line Extension project, our products have been utilised at landmarks such as Big Ben, London Bridge and many works on and around the Thames Embankment and major main line rail terminals. Associated Polymer Services currently supplies most major UK and European geotechnical companies and in this competitive and ever changing environment will remain at the forefront of design and technology.

Pneumatic Packers:

This double packer has been designed to work in confined areas being just 1120 mm long. The lance can be used with two size packer bodies, 35mm OD and 45mm OD, both being pressure tested to 100 Bar (encapsulated).

- 35mm Dia. suitably inflates to 45mm
- 45mm Dia. suitably inflates to 55mm

These packers are manufactured in solid rubber, complete with steel separating rings to form four seals, thus creating maximum protection

against leakage and formulates the best seal inside the tube for its length.

This lance is also designed to work as a single unit utilising our part No. IP 0076, the length being 1.5 mtrs, and is manufactured in two main dimensions:—

- 30mm OD expansion range to 45mm
- 42mm OD expansion range to 70mm

These dimensions cover packers to maximum working pressure 90 – 100 Bar, although larger dimensions can be achieved at lesser pressures (further details on request).
